About the Dataset

Description: The success of a market-driven approach to seed system development for self-pollinated crops such as beans depends on understanding consumer (i.e., farmer) demand for quality seed products. Double blind field experiments and experimental auctions were conducted with bean farmers in Tanzania to gauge the relative demand for three types of seed products available to farmers in this region that differ in price and quality: certified, quality declared, and recycled. These experiments specifically focused on the following two research questions. First, for a given improved variety (i.e., keeping the genetics constant), what is the perceived difference in the performance of the crop across three seed types – certified, QDS and recycled grain, when the seeds are planted and managed by farmers under their own conditions in a blind experiment? Second, how does the observed differential performance measured by indicators such as filling of pods, plant health, and vigor translate into farmers' WTP for these different seed types? This dataset includes four types of data collected to address these research questions: a) farmer rating of the three seed quality types planted in the farmer managed field demonstration plots. These ratings were based on observed performance during the field days organized around flowering and harvest stages; b) farmer's bid on these three seed quality types during the seed auction experiments conducted on the second field day before harvest; c) farmer survey data; and d) Field experiment yield data after harvest.

Sampling Two districts (Hai and Karatu) were selected based on the importance of bean production in the country. Twelve villages across the two districts were selected in consultation with the local agricultural extension agents. They were purposively selected based on prior participation in a bean project. All the bean growing farmers who attended the field days (who represented close to 80% of bean growing households in a village) participated in the auctions.

Method: **Field Experiments:** In each village one farmer was selected to host the field experiment and to grow the 4 different types of seeds in plots next to each other using farmers' own management practices. Seeds were procured by the researchers and equal quantities of seeds of each type were given to the host farmers to plant on 10x10m plots, which were labeled by letters A, B, C, and D for certified 1 (of certified seeds representing seeds produced in the most recent season), certified 2 (certified seeds from previous season), recycled seed, and QDS respectively. Apart from the different letters assigned to the seed types, all the seeds were treated with seed dresser of the same color and packaged in similar bags. The planting was done by the host farmers under the supervision of the agricultural extension agent and the research collaborator. Supervision during the planting stage was to ensure uniform planting rate and to avoid mixing of the seed types. Neither the farmers' nor the extension agent who helped in the technical supervision knew which seed type was associated with which letter. These field experiments were established in the 2015 short rain season (July-September) in the Hai district, and in the 2016 long rain season (March to July) in the Karatu district. Subsequent operations post-planting such as refilling, first and second weed control, insecticide spraying, reshaping of ridges and harvesting were uniformly carried on each plot by the host farmer. Agricultural extension agents and the research collaborator paid regular visits to prompt the host farmers to comply with the timely and uniform implementation of these practices and to ensure all the operations were uniformly implemented on the same day on each of the plots to ensure that differences that will be observed across the seed plots would be attributed to the differences in the seed types and not due to differential treatments. Two field days were held in 12 villages where

other farmers from those villages were invited to observe the demonstration plots around flowering stage (Field Day 1) and around harvest stage (Field Day 2). During the field days, each farmer attendee was asked to evaluate the performance of the seed plots based on visual characteristics they considered important, and rate one plot (i.e., seed type) as the best (both field days) and one as the worst (Field Day 2 only).

Auction experiments: Once farmers had observed how different types of seeds performed in the field, WTP auctions were carried out during Field Day 2 to elicit information about how much they were willing to pay for these seeds based on the observed differences in their performance. We followed the Becker-DeGroot-Marschak (BDM) (Becker, DeGroot and Marschak, 1964) method, where participants do not bid against other people, but only against themselves. The full bidding method was used, whereby farmers participated in four auctions (i.e., one each for seed types A, B, C, and D). Farmers were asked to “bid” their maximum WTP for one kilo of seed for a given type of seed (referred to by the letter labels) knowing that only one of the three or four auctions would be chosen randomly and the bid for that seed would then be compared to a randomly drawn price from a given revealed range equivalent to their endowment. This revealed price range was 0 to 3,950 Tanzanian Shillings (TSH). If the bid was greater than or equal to the randomly drawn price, then the farmer purchased that seed for the randomly drawn price (not their bid). The difference in the bids between the three/four auctions reveals the premium (or discount) due to the different quality attributes as perceived by the farmer. . Farmers were given 400 TSH equivalent to \$2 as their initial endowment so they didn’t have to bid using their own money. ¹ These amounts for the initial endowments were equivalent to about 33% more than the price of one kg of certified (i.e., highest quality) seed available in the market. Prior to the seed BDM auction, a practice BDM auction was conducted with a bar of soap (a product that has a readily apparent valuation) to make sure farmers understood the auction mechanism. An additional small amount of cash (i.e., TSH 400) equivalent to ~\$0.50 was given to farmers for this practice BDM auction.

Farmer survey: Farmers selected for the study and who had attended both the field days and the auction experiments were interviewed using a structured questionnaire. The questionnaire collected demographic information about the farmer participant (i.e. respondent) and his/her household characteristics, bean production practices, and farmers’ perception and opinion of the seed quality. The survey was conducted by trained enumerators with technical support and supervision by one of this study’s Principal Investigators.

¹ The exchange rate from 1 US\$ to local currency at the time of these experiments was about 2100 Tanzanian Shillings (TSH).

Overview

Overview

Type	Edited, anonymous dataset for public distribution
Identification	N/A
Version	v01
Kind of Data	field experiment, auction experiment, and farmer survey data
Unit of Analysis	farmer and farm plots
Language	Survey was implemented in local language, data was recorded in English in English version of the questionnaire
Questionnaires	Available only in English version

Scope & Coverage

Time Period(s)	2015-2016
Countries	Tanzania
Regional coverage:	12 villages in Hai and Karatur districts in Northern Tanzania

Producers & Sponsors

Primary Investigator(s)	Mywish Maredia and Robert Shupp, Michigan State University; Fulgence Mishili, Paul Kusolwa and Abdul Kudra, Sokoine University of Agriculture; Byron Reyes (CIAT)
Contact email for corresponding PI:	maredia@msu.edu
Funding Agency/ies	U.S. Agency for International Development (USAID)

Data Collection

Data Collection Dates	start 2015-07-1; end 2016-7-31

Variables Description

Dataset contains 255 variable(s)

File : Field day 1 farmer rating

fid: farmer ID

Information [Type= continuous] [Format=numeric] [Range= 11002-96099] [Missing=*]

Statistics [NW/ W] [Valid=282 /-] [Invalid=0 /-] [Mean=57059.124 /-] [StdDev=35630.051 /-]

FE_id: Field experiment ID

Information [Type= continuous] [Format=numeric] [Range= 11-96] [Missing=*]

Statistics [NW/ W] [Valid=282 /-] [Invalid=0 /-] [Mean=57.043 /-] [StdDev=35.627 /-]

X2: Gender

Information [Type= discrete] [Format=numeric] [Range= 1-2] [Missing=*]

Statistics [NW/ W] [Valid=282 /-] [Invalid=0 /-]

Value	Label	Cases	Percentage
1	male	165	58.5%
2	female	117	41.5%

Warning: these figures indicate the number of cases found in the data file. They cannot be interpreted as summary statistics of the population of interest.

X3: Age (years)

Information [Type= continuous] [Format=numeric] [Range= 15-84] [Missing=*]

Statistics [NW/ W] [Valid=282 /-] [Invalid=0 /-] [Mean=41.638 /-] [StdDev=13.89 /-]

X4a: Total # of HH members participating in this field day

Information [Type= continuous] [Format=numeric] [Range= 1-32] [Missing=*]

Statistics [NW/ W] [Valid=282 /-] [Invalid=0 /-] [Mean=1.883 /-] [StdDev=3.13 /-]

X4b: Main decision maker

Information [Type= discrete] [Format=numeric] [Range= 1-2] [Missing=*]

Statistics [NW/ W] [Valid=282 /-] [Invalid=0 /-]

Value	Label	Cases	Percentage
1	yes	264	93.6%
2	no	18	6.4%

Warning: these figures indicate the number of cases found in the data file. They cannot be interpreted as summary statistics of the population of interest.

X6_1: First criteria for ranking

Information [Type= discrete] [Format=character] [Missing=*]

File : Field day 1 farmer rating

X6_1: First criteria for ranking

Value	Label	Cases	Percentage
Good pods set		3	1.1%
Good stand		15	5.3%
High production		21	7.4%
High production,good stand		2	0.7%
High productivity/yie;d		114	40.4%
High yield		49	17.4%
Less diseases		1	0.4%
Less yield		3	1.1%
More pods,vigorous		1	0.4%
No climbing varieties		9	3.2%
No diseases,high production		10	3.5%
No yield		2	0.7%
Poor pods maturity		1	0.4%
Production		1	0.4%
Production good		1	0.4%
Production,less diseases		1	0.4%
Production,no diseases		1	0.4%
Resistant to pest		5	1.8%
Vigor		1	0.4%
Vigorous		18	6.4%
Vigorous,diseases resistant		1	0.4%
Vigorous,high yield		1	0.4%
Pods maturity		1	0.4%
yield		2	0.7%

Warning: these figures indicate the number of cases found in the data file. They cannot be interpreted as summary statistics of the population of interest.

X6_2: Second criteria for ranking

Information	[Type= discrete] [Format=character] [Missing=*]		
Statistics [NW/ W]	[Valid=282 /-] [Invalid=0 /-]		
Value	Label	Cases	Percentage
Better than B		2	0.7%
Diseases		1	0.4%
Diseases attacked		4	1.4%

File : Field day 1 farmer rating

X6_2: Second criteria for ranking

Value	Label	Cases	Percentage
Diseases resistant,high yield		5	1.8%
Diseases,high production		1	0.4%
Early flowering		3	1.1%
Early maturity		5	1.8%
Early pods maturity		1	0.4%
Good crop stand		6	2.1%
Good growth		4	1.4%
Good performance		3	1.1%
Good pod production		1	0.4%
Good pod set		3	1.1%
Good pod set (long)		1	0.4%
Good pod set (uniform)		1	0.4%
Good seed		2	0.7%
Good stand,diseases resistant		8	2.8%
High production		11	3.9%
High production,disease		1	0.4%
High production,weak stand		1	0.4%
High productivity/ yield		14	5.0%
High yield		15	5.3%
High yield,insects attacked		1	0.4%
It has space		1	0.4%
Less diseases		2	0.7%
Less production		1	0.4%
Less yield		9	3.2%
Low production		2	0.7%
Low yield		1	0.4%
Mixed climbers		1	0.4%
Mixed seeds		1	0.4%
Mixed types of seeds		2	0.7%
No climbing varieties		20	7.1%

File : Field day 1 farmer rating

X6_2: Second criteria for ranking

Value	Label	Cases	Percentage
No diseases		16	5.7%
No disesaes		1	0.4%
No early maturity		1	0.4%
No mixed climbers		5	1.8%
No mixture		2	0.7%
No mixture of seeds		1	0.4%
Pods maturity is okay		1	0.4%
Poor pod set		1	0.4%
Production		4	1.4%
Production of goods pods		1	0.4%
Resistant to pest		53	18.8%
Slow maturity		2	0.7%
Vigor		3	1.1%
Vigorous		49	17.4%
Vigorous,less pods		1	0.4%
Vigourous		1	0.4%
high production		1	0.4%
insects infection		1	0.4%
vigor,diseases infection		1	0.4%
yield		3	1.1%

Warning: these figures indicate the number of cases found in the data file. They cannot be interpreted as summary statistics of the population of interest.

X6_3: Third criteria for ranking

Information	[Type= discrete] [Format=character] [Missing=*]
